TITLE: The metallographic method of determining non-metallic
inclusions

PERIODICAL: Standartizatsiya, no. 11, 1961, 27-33

TEXT: The draft standard: "Steel - The metallographic method of determining inclusions" was prepared by the Tsentral'nyy nauchno-issledovatel'skiy institut chernoy metallurgii (Central Scientific Research Institute of Ferrous Metallurgy) and the Ukrainskiy nauchno-issledovatel'skiy trubnyy institut (Ukrainian Scientific Research Institute of Pipes). It includes a scale, covers non-metallic inclusions, and envisages random sampling when the disposition of material is unknown, or from three points along the height of ingots. The project recommends discussion on the quantity of specimens which would ensure the required accuracy.

Card 1/2

The metallographic ...

S/028/61/000/011/003/004
D221/D301

The suggested scale for evaluating non-metallic inclusions distinguishes three groups: Oxides, globular and sulphides. The scale division is based on the area taken up by the inclusions in one field of viewing, and which increases in a geometrical progression of 2 when passing from one mark to another. In 1959, the UkrNITI developed a special scale for streaky nitride inclusions of titanium in steel rolled sections. The project prescribes a 90 - 110 times magnification. The area taken up by inclusions of mark 3 is equal to that of the same mark scale of (GOST) 80-160. There are tabulated areas of various inclusions and their classification necessitates the separation of silicates into an individual group. They form greatly deformed, plastically deformed and non-deformed inclusions. The project assumes the average mark from the maxima of specimen evaluations of inclusions as a criterion of casting. This is confirmed by statistical analysis. The errors in determining the average mark, and the method of their calculation for some types of inclusions are defined by the project of the standard. There are 2 figures, 5 tables and 9 Soviet-bloc references.

TITLE: Recovery of the sensible heat of reaction gases in the manufacturing of acetylene

SOURCE: Revista de chimie, v. 16, no. 3, 1965, 125-133

TOPIC TAGS: acetylene, natural gas, ethylene, hydrocarbon, methane, oxidation

ABSTRACT: The authors discuss the preparation of acetylene from natural gases by electric arc cracking and by partial oxidation, with special attention to the best possible utilization of the energy consumed during these processes. Some data are given for a method allowing the partial recovery of some of this energy, namely the injection of additional liquid hydrocarbons into the hot cracked gases, yielding an additional quantity of acetylene plus ethylene. The data were obtained in a semi-industrial Rumanian installation for electrothermic methane cracking. This work was carried out at Chemical Plant, Risnov. Orig. art. has: 13 figures and 13 formulas. TITLE: The dependence of the neutron dosage rate on the γ -radiation dosage rate for commercial Po-Be sources

PERIODICAL: Referativnyy zhurnal, Fizika, no. 3, 1963, 49, abstract 3A380 ("Studii si cercetări fiz. Acad. RPR", no. 3, 1963, v13, 427 - 435, Rumanian; summaries in Russian and French)

TEXT: A simple method is proposed for calculating the dosage rate from the neutrons for the Po-Be sources by the γ -radiation dosage rate measured behind a given protective screen. Obtained was the relation

$$b_{n,r} = (1 - p_{\gamma,r}) b_{\gamma,r} / p_{\gamma,r}$$

where $b_{n,r}$; $b_{\gamma,r}$ is the dosage rate of the neutrons and the γ -quanta respectively, and $p_{\gamma,r}$ - the portion of the full dosage rate, depending on the γ -quanta. The theoretical data are experimentally checked. The final results are presented in the form of nomograms.

The Action of an Extract of the Thymus Gland on Tissue
Respiration

Orig Pub : Studii si cercetari endocrinol. Acad. RPR, 1956, Vol 7,
No 3, 317-324

Abstract : The muscles and testes of rabbits were denervated. Tissue respiration was studied by the Warburg method in a phosphate medium at pH 7.0. With the addition of extract of thymus gland (TGE) to the tissue of muscles and testes taken from intact animals, there was an increase in O₂ consumption. Following denervation, this effect of TGE did not occur. The addition of TGE to muscles taken

twenty days after transection of the Achilles tendon produced, in both experimental and control animals, an increase in O₂ consumption. Changes in the cerebral cortex produced by stimulation (benzedrine) or inhibition (luminal) did not alter the effect of TGE upon addition of it to muscle tissue - the tissue respiration increased. A decline in the effect following addition of TGE to the tissues after denervation is regarded by the authors as proof of a connection between this reaction and the integrity of the nervous system. -- E. In the agricultural research Institute of Moldavia during 1950 to 1954 at six experimental stations, the highest seed crops of dew grass (1.3), meadow fescue (1.7), timothy grass (1.6), pasture ryegrass (1.6) and tall fescue (1.6) were obtained. In broad-row sowing (1.5 to 1.0 cm between rows) with sowing quota of 1.5 to 1.0 kg/m² for wheat and 0.7 to 0.5 kg/m² for rye and 0.5 to 0.3 kg/m² for TO, in a number of regular

it is expedient to sow LF, TG and LR under a cover of two-row barley. The duration of the period of use for seed is not above 3 years. The wetting of DG and LF needs before sowing hastens the appearance of sprouts by 3 to 5 days, but does not yield a gain to the harvest. Next sowing with 60 x 60 cm spacing gave a crop practically close to the row sowing. 60 cm spacing between rows and cannot be recommended because of the higher net cost of seed production. -- N.V. Drenishnikov

 TITLE : The Zoning of Cotton Plants in Rumania.

ORIG. PUB. : An. Inst. cercetari agron., 1957, 24,
 No 5, 305-348
 ABSTRACT : In 1950-1952 comparative variety trials of 9 varieties of cotton plants were conducted in various cotton growing areas of Rumania. The variety Odessa 1 was used as controls. In addition to yields, a determination of agronomic, physical, and technological characteristics was made for each variety. In all the zones the best indices were exhibited by Soviet variety No 1298, which, due to the high yield of fiber produced the largest harvest (6-27% greater than all other varieties). In some individual instances this variety showed delayed opening of the bolls (1-3 days later than in early varieties), but because of more rapid maturation, it was ready for harvest at the same time as the earliest varieties, of those that

abstract 123361 (issv. 12 Kirgizsk. ser. yestestv. i
tekhn. n., no. 2, 1962, 93-108 (summary in Kirg.).)

Text: Frontal thunderstorms cause the most damage to ground objects, which should be considered when choosing electric protection for transmission lines that are being planned or constructed, and other installations. Observational data for 1959, a year characterized by maximum thunderstorm activity on Kirghizian territory, are processed statistically and synoptically. Frontal thunderstorms are subdivided into two types: storms associated with the passage of primary cold fronts and those related to passing secondary or occluded fronts. Intraness thunderstorms are also subdivided into two types: storms related genetically to the advection of
